

Unified Calculator — UI/UX Design Brief

A single, stacked-customization investment calculator covering SIP, Lumpsum, Step-up SIP, SWP and EMI — engineered so every assumption, formula and rupee is visible to the customer. Built for total transparency, not a black box.

VERSION	FEATURE	PLATFORM	OWNER
v1.0 · Jun 2026	Unified Calculator	Responsive Web · Desktop-primary	Percent Product

00 Project Overview

SUBJECT

A unified financial calculator that lets a customer model SIP, Lumpsum, Step-up SIP, SWP and EMI in one place — with every input exposed as a control and every output explained.

AUDIENCE

Retail Indian investors comparing options before committing — first-time SIP starters through to people planning withdrawals (SWP) or loans (EMI). Numerically curious, mobile-and-desktop, trust-sensitive.

THE SCREEN'S SINGLE JOB

Let someone change an assumption and instantly see — and understand — what it does to their money. Confidence through clarity, not just a final number.

WHY WE WIN

Groww, Zerodha & bank calculators show a number and hide the math. Percent shows the number *and* the formula, the assumptions, and the year-by-year breakdown behind it.

★ SIGNATURE ELEMENT — THE TRANSPARENCY PANEL

Every result card carries an expandable panel that reveals the exact formula used, the compounding/timing assumption (annuity-due vs ordinary, effective vs nominal rate), and an editable assumptions footnote. This is the one idea repeated across all five modes and the thing Percent should be remembered for.

01 Logo & Wordmark

The Perccent wordmark stays in Bricolage Grotesque, tight tracking. The calculator lives under the product shell — the logo anchors the top-left, never recoloured, never stretched. On the primary blue header it reverses to white.

LIGHT / DEFAULT

perccent

ON PRIMARY BLUE

perccent

02 Colour Palette

Carried directly from Perccent's product system. Primary blue is the single action colour — one primary button per view. The data-visualisation triad (blue / green / amber) is semantic and must stay consistent across every chart and number on every mode.

CORE BRAND

Primary Blue #0047BD Action / structure / logo	Blue Deep #003392 Hover / pressed	Blue Tint #e8eeFB Selected / value chips	Ink #050606 Body text

DATA-VIZ SEMANTIC TRIAD

03 Typography

Three typefaces, three jobs. Bricolage Grotesque carries personality in headings and big result numbers; Inter handles all UI and body copy; JetBrains Mono is mandatory for every rupee figure, percentage, period and tabular cell so numbers align and never feel sloppy.

DISPLAY — BRICOLAGE GROTESQUE 800 • 46PX • -0.04EM

Plan it. See the math.

HEADLINE — BRICOLAGE GROTESQUE 600 • 24PX • -0.02EM

Your money, with nothing hidden

BODY — INTER 400 • 16PX

Adjust your monthly amount, expected return and tenure. Percent recalculates instantly and shows exactly how each rupee compounds.

NUMERIC DATA — JETBRAINS MONO 500 • 18PX

₹11,20,000 • 12% p.a. • 10 yr • 120 instalments

LABEL CAPS — JETBRAINS MONO 600 • 11PX • 0.08EM

MATURITY VALUE • EFFECTIVE RATE • ANNUITY-DUE

04 Modes & Data Visualisation

Five modes share one engine and one visual language. Each mode has a fixed icon and a primary chart. Charts are never decorative — colour maps to the semantic triad, and every chart has a matching legend with exact figures.

SIP

Monthly investing ·

Rising SIP · area

SWP

Withdrawals · depletion

EMI

Loans · split + schedule

Chart rules

- **Donut** (SIP, Lumpsum): Invested (blue) vs Returns (green). Centre shows total corpus in Bricolage.
- **Stacked area / growth curve** (Step-up): contribution band + growth band over time.
- **Depletion line** (SWP): corpus balance month-by-month, with a marker where it hits zero.
- **Principal vs Interest split + amortisation table** (EMI): bar split + scrollable schedule.

05 Inputs & Micro-interactions

The signature control is the slider-plus-value-chip pair, lifted from the best of Groww/Zerodha but improved: the chip is directly editable (type an exact figure), and the slider snaps to sensible steps. Every change recalculates in real time with a number count-up — never a jarring jump.

SLIDER + EDITABLE VALUE CHIP

Monthly investment

₹5,000

Expected return (p.a.)

12%

Time period

10 yr

Interaction rules

- Slider drag and chip edit are always in sync — change one, the other follows.
- Out-of-range typed values clamp to min/max with an inline hint, never an error modal.
- Recalculation is debounced (~120ms) so dragging stays smooth; results count-up over ~400ms.
- All controls keyboard-accessible; sliders respond to arrow keys with the same step.

06 The Result + Transparency Panel — Signature Element

This is the component the whole product repeats: a two-panel layout (controls left, results right) where the result card always exposes the math behind it. The Transparency Panel is what separates Perccent from every competitor — it turns a black-box number into something the customer trusts and learns from.

ESTIMATED MATURITY VALUE

₹11,20,000

Show the math & assumptions

$$M = P \times ([(1+i)^n - 1] / i) \times (1+i)$$
$$i = 12\% / 12 = 1\% \cdot n = 120 \cdot P = ₹5,000$$

Assumes monthly compounding, contributions at the **start** of each month (annuity-due), constant 12% annual return, and no exit load or tax. Toggle to ordinary annuity or nominal rate to compare.

Rule: the Transparency Panel appears on every mode. The formula block uses the dark mono style; the assumptions note always states the timing convention (annuity-due vs ordinary) and rate convention (effective vs nominal) explicitly.

08 Motion & Animation Principles

Motion exists to make recalculation legible, never to perform. The rule of thumb: the more often a customer triggers a motion, the faster and quieter it must be.

MOMENT

FREQUENCY

TREATMENT

Result count-up

Every input change

~400ms ease-out number tween; chart arcs morph in sync. No bounce.

Slider drag

Constant

Instant, debounced ~120ms. Zero animation on the knob itself.

Mode switch

Occasional

200–250ms cross-fade between panels; chart type morphs, doesn't pop.

Transparency Panel open

Occasional

Height auto-expand 220ms ease; formula fades in.

SWP depletion-to-zero

Rare (per scenario)

Most expressive moment — the line draws and the zero-marker pulses once.

Non-negotiable: every animation respects prefers-reduced-motion and falls back to an instant state change.

09 Layout & Spacing

Desktop-primary, two-panel: controls left, results right. On mobile the panels stack — controls first, results sticky-summarised at the top so the number is always in view while scrolling. Spacing runs on an 8px base.

Breakpoints: 1280px+ desktop (primary, fully designed) · 768–1279px tablet (two-panel collapses gracefully) · 360px+ mobile (stacked, results summary sticky).

10 Light Mode / Dark Mode

Both are fully designed states, not an inverted filter. The semantic triad (invested / returns / withdrawn) shifts brighter on dark to hold AA contrast, but the meaning of each colour never changes.

LIGHT MODE

₹11,20,000

canvas #f7f9fc · blue #0047BD · ink #050606

DARK MODE

₹11,20,000

canvas #0b1020 · blue #5b8cff · brighter triad

11 Do / Don't

✓ Do

- + Expose every assumption — always show the timing (annuity-due vs ordinary) and rate (effective vs nominal) convention in plain language.
- + Keep one primary blue button per view; everything else is secondary or ghost.
- + Use JetBrains Mono for every rupee figure, percentage and table cell so numbers align.
- + Keep the semantic triad consistent: invested = blue, returns = green, withdrawn/interest = amber, on every mode.
- + Recalculate live and count-up — never make the user press "calculate" to see a change.

✗ Don't

- Don't hide the math — a number with no visible formula is the exact thing we're replacing.
- Don't use pure black — always Ink #050606 (and its dark-mode equivalent).
- Don't use green for anything that isn't growth/returns, or amber for anything that isn't withdrawal/interest.
- Don't animate frequent interactions (drag, count-up) longer than ~400ms.
- Don't show a maturity figure without stating it's pre-tax and free of exit load, where relevant.

Brand tokens carried from the Percent product system. Section structure mirrors the Percent design-brief format. Calculator spec per the Unified Calculator PRD.
